

Burgers zero adversarial training: polished diagnostic dashboard

52/52 datasets improved | mean Relative L2 0.0305 -> 0.0138 | mean fractional drop 55.1%

Burgers ADV-only training: loss reduction by dataset

Relative L2: 52 / 52 datasets improved

RMSE: 52 / 52 datasets improved

train test near_param_shift mid_kernel_spectrum far_range_pattern target_loss_kernel_shift target_loss_param_shift

Relative L2 across 52 datasets and 1001 evaluation epochs

Burgers ADV-only: 50-epoch checkpoint loss behavior

50-epoch checkpoint loss summary: group mean $\pm$ std

50-epoch checkpoint-to-checkpoint change
blue = lower loss, red = higher loss

Attack loss bucket analysis

5 epsilon buckets: attack loss gain

5 epsilon buckets: relative attack gain

10 training-progress buckets: clean / adv / gain

Raw attack loss progress, no moving average

Solid line is the raw per-epoch mean; shaded band is pooled mean $\pm$ std from epsilon buckets.

Clean loss before attack

ADV loss after attack

Attack gain = adv - clean

Raw epsilon-bucket attack curves with standard-deviation shading

No moving average: every line is the raw epoch mean for that bucket; shading is mean $\pm$ std inside the bucket.

ADV loss after attack by epsilon bucket

Attack gain by epsilon bucket

Adversarial delta shifts toward high-frequency Fourier modes
